Routes Across the Seas

DOCUMENTED BRIDGES BETWEEN MATHEMATICAL TOOLS

21

documented bridges with mapped endpoints

ROUTE DIRECTORY

B01	Elliptic curves → modular forms
B02	Modular forms → sphere packing in 8D
B03	Hodge theory → log-concavity for matroids
B04	Local lemma → resampling algorithms
B05	Dense combinatorics → prime progressions
B06	Optimal transport → synthetic Ricci curvature
B07	Expander graphs → error-correcting codes
B08	Model-theoretic stability → graph regularity
B09	Intuitionistic logic ↔ typed λ-calculus
B10	Dependent types ↔ homotopy structure
B11	Operator algebras → knot invariants
B12	Covering spaces ↔ fundamental-group subgroups
B13	Radical ideals ↔ affine algebraic sets
B14	Curvature integrals → Euler characteristic
B15	Brownian paths → parabolic PDEs
B16	Sparse geometry → convex recovery
B17	Concentration → Euclidean dimension reduction
B18	Topological zero principles → polynomial partitioning
B19	Semidefinite optimization → zero-error capacity bounds
B20	Finite-field interpolation → Reed–Solomon codes
B21	Polynomial root bounds → interactive proofs

A bridge works through transferable structures and explicit assumptions.

Only documented bridges with matched endpoints appear. Curves are not implication arrows; their length and position are not mathematical distances. See the bridge report for assumptions and sources.
